

EMA Leads Funnel Build Brief for ChatGPT Prompt Generation

Document Purpose

This document is written for a two-step workflow:

1. Joshua reads this brief and understands the product direction.
2. Joshua gives this brief to ChatGPT so that ChatGPT can analyse it holistically and return phased building prompts for implementation.

For that reason, this brief is written as an instruction-grade product document. It is not only descriptive. It is meant to help another AI system generate structured build prompts, phased tasks, UI logic, and implementation sequences.

Output Expected from ChatGPT

When Joshua loads this into ChatGPT, ChatGPT should produce:

- A phased build sequence.
- Page-by-page or component-by-component prompts.
- UX and logic prompts.
- Data-capture prompts.
- CTA and content prompts where useful.
- A sensible order of implementation for a front-end funnel.

The funnel brief should be interpreted as a product-routing and pre-intake system, not a full internal operations dashboard.

Funnel Objective

The EMA leads funnel exists to do four things:

1. Attract and frame the user's problem clearly.
2. Help the user identify the correct route quickly.
3. Convert the user into the correct intake path.
4. Hand the user into the EMA main application with clean route context.

The funnel is not a generic landing page. It is a qualification and routing layer.

Funnel Product Positioning

The funnel should be designed around urgent migration pain, especially practical real-world problems.

The two most important problem pillars are:

1. Overstayed / Undesirable

This is a major funnel pillar and must receive strong visibility.

The funnel should speak directly to users who:

- Overstayed in South Africa.
- Were declared undesirable.
- Are afraid to leave or re-enter.
- Need help understanding appeal, upliftment, regularisation, or next legal step.

This category is important because it maps to urgent intent and high-conversion problem awareness.

2. Visa Anomalies / Stuck Applications

This is the second major funnel pillar.

The funnel must speak directly to users dealing with:

- Incomplete applications.
- Mismatched applications.
- Applications stuck at Home Affairs.
- Long pending matters.
- Situations where they cannot work, bank, travel, or move because their matter is unresolved.
- Fear of leaving South Africa while an application is pending.

The funnel should show that EMA understands the problem and has a structured route to resolve it.

Funnel Routes

The funnel must present four primary entry routes.

1. Traveller

For people planning travel, movement, re-entry, or dealing with travel-linked visa concerns.

2. Overstayed / Undesirable

For people who overstayed, were declared undesirable, or are dealing with overstay consequences.

3. Firm / Professional

For immigration practitioners, law firms, HR, mobility teams, institutional actors, or professional partners.

4. Continue with Reference Number

For returning users who already have a case or reference and need to continue, update, or check progress.

Funnel UX Goal

The user should reach the correct route with minimum confusion.

The funnel should:

- Present clear route cards.
- Use plain, urgent, practical language.
- Explain the problem before asking for details.
- Use strong CTAs.
- Separate first-time users from returning users.
- Make overstay and anomaly help feel immediate and credible.

Funnel Content Requirements

The content inside the funnel must not be generic corporate copy. It should be problem-led.

Core message types

- “Your visa application is stuck.”
- “You overstayed and do not know what happens next.”
- “Your documents or outcome do not match.”
- “You cannot travel, work, bank, or move because your matter is unresolved.”
- “EMA helps route, diagnose, and handle the issue properly.”

Content structure recommendations

- Headline that names a real migration problem.
- Short explanatory block.
- Route selection options.

- Supporting urgency section.
- CTA into the appropriate intake path.

Funnel Logic

The funnel should classify the user according to:

- Problem type.
- Urgency.
- Individual versus firm/professional.
- New matter versus existing matter.

The funnel does not need to solve the case. It only needs to route the case correctly and pass context forward.

Data the Funnel Must Pass Forward

When the user leaves the funnel and enters the main EMA application, the following should already be known or inferred where possible:

- Route selected.
- Problem theme.
- Whether the case is new or existing.
- Whether the user is an individual or professional actor.
- Whether there is likely urgency or anomaly.

Funnel Pages or Sections

ChatGPT should interpret the funnel as having these likely sections:

1. Hero / main problem statement.
2. Route selection section.
3. Overstay-specific support section.
4. Stuck application / anomaly-specific support section.
5. Firm / professional route positioning.
6. Continue with reference number path.
7. CTA transitions into intake.

Constraints

The funnel should not become too large or operationally heavy.

It is not the place for:

- Deep dashboard logic.

- Full case management.
- Long legal analysis.
- Internal workflow complexity.

Its job is front-end qualification, trust, and conversion.

Instruction to ChatGPT

When this brief is analysed by ChatGPT, the response should:

- Break the funnel build into phases.
- Suggest the best sequence for building screens and logic.
- Generate prompts Joshua can use one by one to build the funnel.
- Prioritise route logic, content framing, CTA clarity, and handoff into the main application.
- Treat the overstay and stuck-application pathways as premium priority journeys.

Final Standard

The funnel is successful only if:

- The user immediately recognises their problem.
- The user chooses the correct route quickly.
- The funnel reduces confusion rather than adding it.
- The CTA into the main application feels natural and trustworthy.
- EMA looks like a structured migration problem-solving platform rather than a generic enquiry form.
